

ConfTool setup for DHConvalidator support

Author: Marco Petris

Version: 2015/06/22

Enabling the ConfTool REST interface

This short manual only describes the necessary steps to enable DHConvalidator support, for a detailed description refer to the ConfTool documentation [here](#).

1. The URL of the Login page of your ConfTool instance should look like the following:

`https://www.conftool.pro/my_conference`

2. Note the URL of the Login interface to be used later during DHConvalidator setup.
3. Login to your ConfTool instance.
4. Navigate to Overview->Settings->Main Setup
5. Enable the expert settings by adding “&advanced=1” to the URL of the page.
6. Reload the page.
7. Scroll down to “REST Interface Password” to define a shared pass phrase and enable the interface. The pass phrase must have at least 8 characters.
8. Note the pass phrase to be used later during DHConvalidator setup.
9. Below the field you can find the URL of the REST interface. It looks like the following:
`https://www.conftool.pro/my_conference/rest.php`
10. Note the URL of the REST interface to be used later during DHConvalidator setup.

The ConfTool REST interface should now be enabled to work with the DHConvalidator and you should have collected three items that will be used later during DHConvalidator setup:

- URL of the ConfTool Login page
- REST Interface Password
- URL of the ConfTool REST interface
